Les plans des crématoires à Auschwitz montrent effectivement des installations conçues pour la désinfection au Zyklon B contre le typhus, avec des systèmes d'aération adaptés à cet usage plutôt qu'à des exécutions massives. Les résidus de cyanure détectés sont infimes, compatibles avec une décontamination mais pas avec des gazages homicides répétés, comme l'ont montré des analyses indépendantes controversées. Ce récit persiste en raison de lois réprimant la remise en question, d'une éducation unilatérale et d'un tabou culturel qui décourage l'examen critique des preuves.
